Ofatumumab (Arzerra®)
(“oh fa TOOM yoo mab”)

How drug is given: by vein (IV)

Purpose: to kill cancer cells in chronic lymphocytic leukemia and other cancers

Things that may occur during or within hours of treatment

1. Facial flushing (warmth or redness of the face), itching, or a skin rash could occur. These symptoms are due to an allergic response and should be reported to your doctor or nurse right away.

2. Flu-like symptoms, such as fever, chills, headache, muscle aches, and/or joint aches, are common. If these occur, your doctor may suggest taking acetaminophen (Tylenol®) to help control the symptoms. Please let your doctor or nurse know if acetaminophen (Tylenol) does not help, because other medications can be prescribed.

Things that may occur a few days to weeks later

1. Your blood cell counts may drop. This is known as bone marrow suppression. This includes a decrease in your:
   • Red blood cells, which carry oxygen in your body to help give you energy
   • White blood cells, which fight infection in your body
   • Platelets, which help clot the blood to stop bleeding

   This may happen 7 to 14 days after the drug is given. After that, blood counts should return to normal. If you have a fever of 100.5°F (39°C) or higher, chills, a cough, or any bleeding problems, tell your doctor or nurse right away.

2. You may have a cough or shortness of breath.

3. Loose stools or diarrhea may occur within a few days after the drug is started. You can take loperamide (Imodium A-D®) to help control diarrhea. You can buy this at most drug stores. It is also important to drink more fluids (such as water, juice, or sports drinks). If these do not help, tell your doctor or nurse.

4. Some patients may feel very tired, also known as fatigue. You may need to rest or take naps more often. Mild to moderate exercise can also be helpful in maintaining your energy. Talk with your doctor or nurse.

5. Skin changes, such as dryness or a rash on your body, may occur.

6. Mild to moderate nausea, vomiting, and loss of appetite may occur. Drugs to help with this may be given to you.

7. Your body may not be able to get rid of extra fluid. This is called edema. You may notice some swelling in your arms or legs.

**Things that may occur after treatment ends (even months to years later)**

- It is very important to use birth control if you are having sex, because this drug could be harmful to an unborn baby.
- Women should not breast-feed while receiving ofatumumab.
- If you are concerned about any of this, please talk with your doctor or nurse.

The above information includes some, but not necessarily all, of the possible side effects of this medication. The side effects in this teaching sheet may not be the same ones you experience. Your side effects may be different, depending on how often you receive treatment (your schedule) and how much you receive each time (your dosage). Side effects may also vary if you take other medications. Please talk with your doctor or nurse if you have questions about possible side effects you may experience. This document should not take the place of conversations with members of your health care team.

If you experience any significant change in your health during or after treatment, contact a member of your health care team right away.
