

Exercise and Cancer

Exercise offers far-reaching benefits for cancer survivors. It can help reduce fatigue, increase energy, improve quality of life, and even help with certain side effects of treatment. Research shows that exercise can be safe both during and after cancer treatment. We encourage all patients to live an active lifestyle.

How much exercise should I get?

Depending on your age, previous exercise experience, energy levels, side effects from treatment, and other health concerns, exercise recommendations may vary. **Please talk with your physician before beginning an exercise program.** You may need a personalized exercise plan if you have: extreme fatigue, osteoporosis, or peripheral neuropathies. Some general recommendations from the American Cancer Society and American College of Sports Medicine:

- **Every week, get 150 minutes of moderate intensity activity or 75 minutes of vigorous intensity activity**
- **Exercise for at least 10 minutes per session, preferably spread throughout the week**
- **Aim for at least two weekly sessions of strength training**

Start your exercise routine under the supervision of a physical therapist, exercise physiologist, or certified personal trainer. To find a **Certified Cancer Exercise Trainer** in your area, visit <http://certification.acsm.org>, click on "Find a Pro," and select "ACSM/ACS Certified Cancer Exercise Trainer" in the dropdown menu on the search page.

Types of exercise

Adult Survivorship Program

a member of the LIVESTRONG Survivorship Center of Excellence Network

How to get started

- Start slowly and progress slowly
- Exercise in several 10-minute increments throughout the day
- Build up to 30 minutes of exercise every day
- Choose an activity that you enjoy

How can I fit exercise into my day?

- Walk or bike to your destination
- Use a stationary bike or treadmill while you watch TV
- Exercise with family, friends, or co-workers
- Take a short walk on your lunch break
- Wear a pedometer and try to add steps whenever you can
- Take the stairs instead of using an elevator or escalator

Moderate Exercise

- Ballroom and line dancing
- Canoeing
- General gardening (raking, trimming shrubs)
- Sports where you catch and throw (baseball, volleyball, softball)
- Tennis (doubles)
- Walking briskly
- Water aerobics

Vigorous Exercise

- Biking faster than 10 miles/hour
- Aerobic/fast dancing
- Heavy gardening (digging, hoeing)
- Hiking uphill
- Jumping rope
- Jogging or running
- Sports with a lot of running (basketball, hockey, soccer)
- Swimming laps
- Tennis (singles)

Is it 'moderate' or 'vigorous' exercise?

A great way to tell the difference between whether you are engaging in **moderate** or **vigorous** exercise is to see how your body is responding to the activity.

- **Moderate:** If you still have the ability to hold a conversation while engaging in a particular exercise, that exercise would generally be considered moderate.
- **Vigorous:** If you are only able to say one or two words due to shortness of breath, that exercise would generally be considered vigorous.

Still have questions?
