

Enzalutamide (Xtandi®)

(“En-za-LOO-ta-mide”)

How drug is given: By mouth

Purpose: To slow the growth of prostate cancer by blocking a male hormone called testosterone.

How to take this drug

1. Take this drug once daily, at the same time each day.
2. Swallow each capsule whole; do not crush, open or chew them. If you have trouble swallowing the capsule, the pharmacist will give you specific instructions.
3. This drug may be taken with or without food. If it upsets your stomach, take it with food.

Storage

- Store at room temperature, away from heat and moisture.
- Keep this medicine in its original container, out of reach of children and pets.
- If you have unused oral chemotherapy pills (tablets or capsules), please return them to the pharmacy where the prescription was filled. Do not flush them down the toilet, dump in the sink, or throw away in the trash.

Things that may occur during treatment

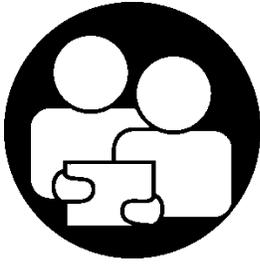

1. During treatment you may experience back pain. Talk with your cancer care team if this pain becomes bothersome or interferes with daily activities.
2. Loose stools or diarrhea may occur after the drug is given. You may take loperamide (Imodium A-D®) to help control diarrhea. You can buy this at most drug stores. It is also important to drink more fluids (water, juice, sports drinks). If these do not help, tell your cancer care team.
3. Mild constipation may occur during treatment.
 - Drink plenty of fluids and increase fiber in your diet by eating fresh fruits and vegetables.
 - A daily stool softener, such as docusate (Colace®), and/or laxatives, such as senna (Senokot®), may help. If these do not help within 48 hours, call your cancer care team.

- Do not use bulk-forming laxatives such as Metamucil® without first talking with your cancer care team.
4. You may feel pain or weakness in your joints or muscles. If this bothers you, ask your cancer care team what drugs you may use to help with this pain.
 5. Your body may not be able to get rid of extra fluid. This is called edema. You may notice some swelling in your arms or legs.
 6. Hot flashes and/or sweats are common. As your body gets used to the drug, this may diminish. Caffeine, spicy food, alcohol, and stress may cause these to get worse. Mild exercise may help.
 7. Some people may feel very tired, also known as fatigue. You may need to rest or take naps more often. Mild to moderate exercise can help maintain your energy.
 8. This drug can increase the risk of seizure. The risk is higher if you are on other medications that increase the risk for seizures. Avoid activities where sudden loss of consciousness could harm yourself or others, including driving or operating machinery. Report any seizures to your cancer care team right away.
 9. In rare cases, a special problem with nerves called reversible posterior leukoencephalopathy syndrome (RPLS) may occur. Patients may have symptoms such as: headache, nausea, feeling sleepy or confused, a change in eyesight, seizures, or other problems. This can happen 16 hours to one year after starting enzalutamide. Early treatment can help, but delayed treatment can result in permanent damage. Call your cancer care team if you have any of these symptoms.
 10. Managing your oral chemotherapy schedule at home can be challenging. To help you with this, consider using tools to help you keep track of your schedule and any side effects you may have. You can find these tools online at www.dana-farber.org/OralChemoDiary.
 11. Fertility and Related Precautions:
 - It is very important to use a condom if you are having sex with a pregnant female, because this drug may be harmful to an unborn baby.
 - You should use a condom and one other form of birth control during therapy and for three months after treatment if having sex with a woman who could become pregnant.

The above information includes some, but not necessarily all, of the possible side effects of this medication. The side effects listed in this teaching sheet may not be the same ones you experience. Your side effects may be different, depending on how often you receive treatment (your schedule) and how much you receive each time (your dosage). Side effects may also vary if you are taking other medications. Please speak with your cancer care team if you have questions about possible side effects you may experience. This document should not take the place of conversations with members of your cancer care team about your treatment and side effects you may experience during and after treatment.

If you experience any significant change in your health during or after treatment, contact a member of your cancer care team right away.

THIS SPACE RESERVED FOR WRITTEN COMMENTS OR NOTES FOR THE PATIENT AND FAMILY:

Oral Chemotherapy Fact Sheet

Oral chemotherapy medicines are given by mouth in the form of capsules, tablets, or liquid. These safety tips will help you understand what to do when you are taking oral chemotherapy.

Please note: If you are on a clinical trial, you may be given special instructions.

How to take this drug

- Swallow each tablet or capsule whole. Do not break, crush, or chew.
- Prepare your drug away from food and food prep areas.
- If you miss a dose, take it as soon as possible. However, if it is almost time for your next dose, skip the missed dose and go back to your regular dosing schedule.
- Do not double the dose.
- If you are on a clinical trial, you will be given special instructions if you miss a dose.
- If you are unable to swallow the pill, speak with your nurse or pharmacist about other ways to take your medication.
- If you vomit or throw up your medication, call your physician for further instructions.
- Wash your hands after taking the medication. Avoid handling crushed or broken pills (tablets or capsules).

Storage

- Most oral chemotherapy medicine is stored at room temperature, away from excess heat and moisture. You will be told if the medication you are taking needs special storage or handling.
- Keep this medicine in its original container, in a safe place, away from other family medications. All medications need to be kept out of the reach of children and pets.

Disposal

- If you have unused oral chemotherapy pills (tablets or capsules), please return them to the pharmacy where the prescription was filled. Do not flush down the toilet, dump in the sink, or throw away in the trash.

Safe handling of body waste in the home after chemotherapy

- Chemotherapy stays in the body for hours or even days, and is found in vomit, urine, stool, and sweat (body wastes). Special care must be taken to prevent the patient's body waste from coming into accidental contact with the patient or caregiver.

Body wastes

Patient and caregiver:

- You can use the toilet (septic tank or city sewage) as usual. There is no research to support double flushing to prevent accidental contact (although this may be suggested for certain medications). Ask your doctor or nurse what they suggest for your medication.
- Wash your hands well with soap and water after using the toilet. If urine, vomit, or stool gets on your body, wash with soap and water. Always wear gloves when cleaning equipment or disposing waste from a urinal or commode.
- Pregnant caregivers should **not** handle patient body waste.
- It is safe for family and friends to use the same toilet, as long as all body waste is cleaned from the toilet.
- To absorb urine or stool, use a disposable, plastic-backed pad, diaper, or sheet. Change it immediately when soiled. Then wash skin with soap and water.
- If you have an ostomy, you or your caregiver may want to wear gloves when emptying or changing appliances.

Laundry

- Always wear disposable gloves when handling sheets or clothes that have been soiled with body waste.
- Soiled items should be kept and washed separately from the other laundry.

Oral chemotherapy is a serious drug that requires extra caution. If you have questions or concerns about your oral chemotherapy, do not hesitate to call your clinician.
